Tip of the Month:

Keep fireworks away from pets!!!

Not only are they harmful if swallowed, but they can cause hearing loss, damage to vision or physical damage such as burns or abrasions.

**POOR PERSONAL HYGIENE** - One of the biggest causes of foodborne illness is poor personal hygiene. People who don't wash their hands properly or often enough are the biggest risks to food safety. (2008 National Restaurant Association Educational Foundation.)

### Monitoring mosquito populations

Adult mosquito populations may be monitored via landing rate counts, or mechanical traps. For landing rate counts, an inspector visits a set number of sites every day, counting the number of adult female mosquitoes that land on a part of the body, such as an arm or both legs, within a given time interval. Mechanical traps use a fan to blow adult mosquitoes into a collection bag that is taken back to the laboratory for analysis of catch. The mechanical traps use visual cues (light, black/white contrasts) or chemical attractants that are normally given off by mosquito hosts (e.g. [carbon dioxide](#), [ammonia](#), [lactic acid](#), [octenol](#)) to attract adult female mosquitoes. These cues are often used in combination.

Monitoring larval mosquito populations involves collecting larvae from standing water with a dipper or a [turkey baster](#). The habitat, approximate total number of larvae and [pupae](#), and species are noted for each collection.

Monitoring larval mosquito populations is done by providing artificial breeding spots (ovitrap) [Ovitrap](#) and collecting and counting the developing larvae in fixed intervals.
