TIP OF THE MONTH

WARNING SIGNS OF

RABIES

Animals

If a wild animal is acting strangely, stay away from it. Some things to look for are:

- general sickness
- problems swallowing
- lots of drool or saliva
- an animal that appears more tame than you would expect
- an animal that bites at everything
- an animal that's having trouble moving or may even be paralyzed

People

In people, it may take one month, two months, or even three months to show signs of rabies. But once people get rabies, they almost always die. That's why it's so important to go see a doctor right away if you've been bitten by an animal that might have rabies.

Early symptoms of rabies in people include:

- fever
 - headache
 - sore throat
 - feeling tired
- If the disease develops, then the signs include:
- pain and tingling at the place they were bitten
 - seeing things that aren't really there
 - a fear of water because of sudden, strong tightening of the muscles in the throat
 - being paralyzed and unable to move parts of the body

Mosquito Fast Facts

- * All mosquitoes MUST have water to complete their life cycle, which is why it is extremely important to drain any standing water from around your property.
- * During warm weather, it takes from three to seven days for a mosquito to complete its life cycle (from egg to adult). So in as little as a week, you could be breeding mosquitoes in any stagnant water found around your property.
- * Mosquitoes only lay their eggs in or near water; they do not develop in grass or shrubbery even though you see adult flying mosquitoes in these areas during the day. Some mosquitoes lay their eggs above water on soil in anticipation of a spring or summer flood event. Often nuisance mosquitoes are found around pastures where flooding occurs.
- * Only the female mosquito bites.
- * Some female mosquito species can survive over the winter to lay her eggs in spring. Female mosquitoes can lay hundreds of eggs at one time - this is called a "brood." Some mosquito species lay multiple broods each summer.
- * Mosquitoes are attracted to people from exhaled carbon dioxide, odors and body heat.
- * Some mosquitoes live their lives close to their breeding source, but others can fly up to 15 miles in their lifetime. The *Culex tarsalis* (which is found in Ada County and carries the West Nile virus) can fly up to two miles a day in search of a blood meal.

Recycling Stats

January 2013

History of the symbol

This Mobius loop was designed by Gary Anderson, a 23-year-old-college student in the late 1960s to 1970. The design was the winning entry for an art contest sponsored by a Chicago-based recycled paperboard company to raise environmental awareness amongst high schools and colleges across the country.

What the symbol means

The triangle in the recycling sign represents the "Reduce Reuse Recycle" Waste Hierarchy.

This hierarchy in turn illustrates the most effective plan of action to reduce waste and conserve natural resources, through "reducing" first, then "reusing" and finally, "recycling".

The three arrows in the symbol represent the three main stages in recycling.

The first arrow represents the first stage of recycling - collection and sorting the various recyclable materials, to prepare them for processing.

The second arrow represents the second stage of recycling - processing the recyclable materials into raw materials and using these raw materials for manufacturing new products.

The third arrow in the symbol represents the third and final stage of the recycling process - the sale and purchase of products created using recycled materials.

The three arrows form a closed loop, illustrating how the three main stages contribute and reinforce one another in the recycling process. The closed loop also means that should any of the stages in the recycling process be ineffective, the sustainability of the entire recycling effort would be affected.
